

# Paradigm Function Morphology I: The ‘basics’

Andrew Murphy

andrew.murphy@uchicago.edu

## Inferential-realizational theories

A word's association with a particular set of morphosyntactic properties determines a sequence of rule applications defining that word's inflectional form.

## 1 Definitions

### Paradigm function

A paradigm function is a function which, when applied to the root of a lexeme L paired with a set of morphosyntactic properties appropriate to L, determines the word form occupying the corresponding cell in L's paradigm.

(1)  $\langle \text{BE}, \{1\text{st, singular, present}\} \rangle \rightarrow \textit{are}$

$\langle \text{BE}, \{1\text{st, singular, present}\} \rangle$  is a *form/property-set pairing* (FPSP)

Paradigm functions are static well-formedness conditions on cells:

- (2) A cell  $\langle W, \sigma \rangle$  in the paradigm of some lexeme L in some language  $\ell$  is well-formed only if  $\ell$ 's paradigm function relates  $\langle W, \sigma \rangle$  to  $\langle X, \sigma \rangle$ , where X is L's root.
- (3)
- Lexeme*: The lexical entry for a word
  - Roots*: A lexeme's default form, devoid of any inflectional marking
  - Stems*: Any expression to which inflectional exponents may potentially be added
  - Words*: The syntactically free forms occupying the cells of a lexeme's paradigm
- (4) A set  $\tau$  of morphosyntactic properties for a lexeme of category C is **WELL-FORMED** in some language  $\ell$  only if  $\tau$  satisfies the following conditions in  $\ell$ :
- For each property  $F: v \in \tau$ ,  $F:v$  is available to lexemes of category C and  $v$  is a permissible value for F.
  - For any morphosyntactic feature F having  $v_1, v_2$  as permissible values, if  $v_1 \neq v_2$  and  $F:v_1 \in \tau$ , then  $F:v_2 \notin \tau$ .

## Extension

Where  $\sigma$  and  $\tau$  are well-formed sets of morphosyntactic properties,  $\sigma$  is an **EXTENSION** of  $\tau$  iff (i) for any atom-valued feature F and any permissible value  $v$  for F, if  $F:v \in \sigma$ ; and (ii) for any set-valued feature F and any permissible value  $\rho$  for F, if  $F:\rho \in \tau$ , then  $F:\rho' \in \sigma$ , where  $\rho'$  is an extension of  $\rho$ .

(5)  $\{\text{TNS: pres, AGR: \{PERS: 1, NUM: pl\}}\}$  is an extension of

- |  |   |
|--|---|
| a. $\{\text{TNS: pres, AGR: \{PERS: 1, NUM: pl\}}\}$ | f. $\{\text{AGR: \{PERS: 1, NUM: pl\}}\}$ |
| b. $\{\text{TNS: pres, AGR: \{PERS: 1\}}\}$          | g. $\{\text{AGR: \{PERS: 1\}}\}$          |
| c. $\{\text{TNS: pres, AGR: \{NUM: pl\}}\}$          | h. $\{\text{AGR: \{NUM: pl\}}\}$          |
| d. $\{\text{TNS: pres, AGR: \{ \} \}$                | i. $\{\text{AGR: \{ \} \}$                |
| e. $\{\text{TNS: pres}\}$                            | j. $\{ \}$                                |

(6) *Format for paradigm functions:*

$$\text{PF}(\langle X, \sigma \rangle) = \langle Y, \sigma \rangle$$

A concrete example

- (7)  $\text{PF}(\langle \textit{be}, \{\text{TNS: pres, AGR: \{PERS: 1, NUM: sg\}}\} \rangle) = \langle \textit{are}, \{\text{TNS: pres, AGR: \{PERS: 1, NUM: sg\}}\} \rangle$
- (8)  $\text{PF}(\langle \textit{be}, \sigma \rangle) = \langle \textit{are}, \sigma \rangle$ , where  $\sigma = \{\text{TNS: pres, AGR: \{PERS: 1, NUM: sg\}}\}$

## Side remark

What about roots associated with more than one lexeme? e.g. *lie* ('recline', 'speak dishonestly')

- (9)
- $\text{L-index}(\textit{lie}) = \text{LIE}_1$  ('recline')
  - $\text{L-index}(\textit{lie}) = \text{LIE}_2$  ('speak dishonestly')

But how do we define what PF is?

## 2 Realization rules

- (10) *Format for realization rules:*  
 $RR_{n, \tau, C}(\langle X, \sigma \rangle) =_{\text{def}} \langle Y, \sigma \rangle$   
 a.  $n$  is the block to which the rule belongs  
 b.  $\tau$  is the property set that the rule can realize through its application  
 c.  $C$  indicates the class of lexemes whose paradigms may be defined by this rule
- (11) *Rule argument coherence:*  
 $RR_{n, \tau, C}(\langle X, \sigma \rangle)$  is defined iff (a)  $\sigma$  is an extension of  $\tau$ , (b)  $L\text{-index}(X) \in C$ , and (c)  $\sigma$  is a well-formed set of morphosyntactic properties of  $L\text{-index}(X)$ .

How does Stump derive:

- (12) a. Blocking of  $-x$  and  $-o$  in 3sg aorist  
 b. Special forms for  $-T, -C?$  / specific 3pl marker for present?
- (13) *Paninian well-formedness condition on inflectional rule blocks:*  
 If  $Q$  and  $R$  are inflectional rules belonging to the same block  $b$ , then for any expression  $X$  and any complete and well-formed set  $\sigma$  of morphosyntactic properties appropriate to  $X$ , either  
 a.  $Q$  and  $R$  are not compatible relative to  $X$  and  $\sigma$ , or  
 b.  $Q$  and  $R$  are compatible relative to  $X$  and  $\sigma$  and either,  
 (i) one is narrower than the other or,  
 (ii) there is a third rule in block  $b$  which is compatible with  $Q$  and  $R$  relative to  $X$  and  $\sigma$  and is narrower than both  $Q$  and  $R$ .

How can a paradigm function be defined in terms of RRs?

- (14)  $\sigma = \{\text{VFORM: fin, VCE: act, TNS: pres, PRET: no, MOOD: indic, AGR: \{PERS: 1, NUM: pl\}}\}$
- (15) a.  $\text{PF}(\langle \textit{krad}, \sigma \rangle) =$   
 b.  $\text{PF}(\langle \textit{dáva}, \sigma \rangle) =$
- (16) **NARROWEST APPLICABLE RULE:**  
 a.  $RR_{n, \sigma, C}$  is **NARROWER** than  $RR_{n, \tau, C}$  iff  $\sigma$  is an extension of  $\tau$  and  $\sigma \neq \tau$   
 b. Where  $C = C'$ ,  $RR_{n, \sigma, C}$  is **NARROWER** than  $RR_{n, \tau, C}$  iff  $C \subseteq C'$ .
- (17) *Nar<sub>n</sub> notation:*  
 Where  $RR_{n, \tau, C}$  is the narrowest rule in block  $n$  which is applicable to  $\langle X, \sigma \rangle$ , ' $\text{Nar}_n(\langle X, \sigma \rangle)$ ' represents the result of applying  $RR_{n, \tau, C}$  to  $\langle X, \sigma \rangle$ .

So, how do we define PF?

- (18) *Paradigm function for Bulgarians verbs:*  
 Where  $\sigma$  is a complete set of morphosyntactic properties for lexemes of category  $V$ ,  $\text{PF}(\langle X, \sigma \rangle) =_{\text{def}} \text{Nar}_D(\text{Nar}_C(\text{Nar}_B(\text{Nar}_A(\langle X, \sigma \rangle)))$

What if no rule is applicable?

- (19) *Identity Function Default:*  
 $RR_{n, \{ \}, \cup}(\langle X, \sigma \rangle) =_{\text{def}} \langle X, \sigma \rangle$

What about the PF giving us  $\langle \textit{krádoxme}, \{\text{TNS: aor, PRET: yes, AGR: \{PERS: 1, NUM: pl\}}\} \rangle$ ?

What about the first singular impf. form?

### Rules of referral

How do we get the RoR for 2sg having the same form as 3sg in preterite tenses?

- (20) *Rule of referral (Bulgarian):*  
 Where  $\tau$  is any complete extension of  $\{\text{PRET: yes, AGR: \{PERS: 2, NUM: sg\}}\}$ ,  $n$  is any of the rule blocks A to D, and  $\sigma' = \sigma / \{\text{AGR: \{PERS: 3\}}\}$ ,  
 $RR_{n, \tau, \nu}(\langle X, \sigma \rangle) =_{\text{def}} \langle Y, \sigma \rangle$ , where  $\text{Nar}_n(\langle X, \sigma' \rangle) = \langle Y, \sigma' \rangle$ .

What does  $\sigma/\rho$  mean?

- (21) a. If  $\sigma = \{\text{TNS: impf, PRET: yes, agr: \{PERS: 2, NUM: sg\}}\}$   
 and  
 b.  $\rho = \{\text{AGR: \{PERS: 3\}}\}$   
 then  
 c.  $\sigma/\rho = \{\text{TNS: impf, PRET: yes, agr: \{PERS: 3, NUM: sg\}}\}$

## 3 Some PFM practice

- (22) *Subject agreement in Nimboran (future tense):*

	singular	dual	plural
1 EXCL	<i>ŋgedúo-d-u</i>	<i>ŋgedúo-k-d-u</i>	<i>ŋgedói<sup>-1</sup>-d-u</i>
1 INCL	<i>maN-ŋgedúo-d-ám</i>	<i>ŋgedúo-k-d-ám</i>	<i>ŋgedói-k-d-ám</i>
2	<i>ŋgedúo-d-e</i>	<i>ŋgedúo-k-d-e</i>	<i>ŋgedói-k-d-e</i>
3 MASC	<i>ŋgedúo-d-am</i>	<i>ŋgedúo-k-d-am</i>	<i>ŋgedói<sup>-1</sup>-d-am</i>
3 FEM	<i>ŋgedóu-d-um</i>	<i>ŋgedúo-k-d-um</i>	<i>ŋgedói<sup>-1</sup>-d-am</i>

What rules/blocks do we need?
